# INFORMATION ARCHIVAL AND RETRIEVAL SYSTEM
# FOR INTERNETWORKED COMPUTERS

## ABSTRACT OF THE DISCLOSURE

5      A computing system can archive information from internetworked computers, such as Internet content, for later retrieval. A server system processes content providers, such as DNS registries and web sites, to extract and store content - including text, image, audio, and video content. For web sites, HTML source code is stored along with a browser-rendered display file. The content is perpetually archived to create a

10   historical record of information for each content provider. An interface is used to retrieve the archived content in response to queries.
